

Backend Explained Simply

What we cooked in the kitchen - No technical words

What is Backend? (The Kitchen)

Think of the website like a restaurant. Frontend is what you see - tables, menu, decoration. Backend is the kitchen you never see - where food is cooked, orders are managed, and everything is stored. We built the kitchen for the car showroom website.

What We Built in the Kitchen

1. A store room (Database) with 5 cupboards: Users (customers & admin), Brands (Maruti, Hyundai etc.), Cars (28 cars with photos, price in rupees, fuel type), Showrooms (10 shops in Navi Mumbai - Vashi, Nerul, Kharghar etc.), Bookings (who booked which car, when).
2. A receptionist (Login system) - checks your ID and password, gives you a token (like a entry pass valid 7 days), keeps passwords secret by scrambling them.
3. A manager (Booking rules) - You pick a car, the manager automatically finds the right showroom for that car brand. Checks that date is in future, time slot (9-6) is free, no double booking. If free, confirms.

How Booking Works - Simple Story

You: I want to test Swift tomorrow at 10am.

Kitchen: Checks - Is Swift available? Yes. Which shop for Swift? Maruti showroom in Vashi. Is 10am tomorrow free at Vashi? Yes. Saves your booking as 'pending'. Admin later sees it and clicks Approve with a message like 'Congratulations, come at 10am with licence' or Reject with reason like 'Slot full, try another day'. You see this message in your dashboard.

What You Don't See But We Made

Security guards: Protects from hackers (checks every request, limits too many tries to 1000 per 15 min). Rules: Only admin can add new cars or see all bookings. Customers see only their own. Automatic cleaning: If you try to book a past date or unavailable car, it says no.

Why It Matters

Without backend, the website would be just photos with no real working. Backend makes it real: your booking is saved, admin can approve, showroom is auto-found, no two people get same slot.
